BUSINESS INTELLIGENCE OVERVIEW REPORT

1. What Is Business Intelligence?

Business Intelligence (BI) is the process of using data to understand how a business is performing and make better decisions. It involves collecting, organising and analysing data to find useful information that can help a business improve.

For example, a retail business can use its sales data to find out which products sell the most, which regions make the most profit and where it may be losing money.

Tools like Power BI help analysts turn data into charts, reports and dashboards that are easier to understand.

2. Why Do Organisations Use Dashboards?

Organisations use dashboards to see important information about their business in one place. Instead of going through large amounts of data, managers can quickly check their performance using charts, figures and other visuals.

A sales dashboard can show total sales, profit, best-selling products, customer segments and regional performance. It can also allow users to filter the information by date, product or region.

Dashboards help organisations track their progress, spot problems early and understand which areas need more attention.

3. How Do Dashboards Help With Decision-Making?

Dashboards make it easier for managers to understand what is happening in their business and decide what to do next.

For example, a region may have high sales but low profit. By checking the dashboard, the business can investigate whether discounts, product costs or shipping costs are affecting its profit.

A dashboard can also show which products perform well and which customer groups bring in more revenue. This information can help the business plan its marketing, manage stock and use its resources better.

However, the information on the dashboard must be accurate for the decisions made from it to be useful.

4. Business Objective of the Global Superstore Dataset

The aim of this project is to use the Global Superstore dataset to understand the company's sales and profit performance with Power BI.

The analysis will look at total sales and profit, compare the performance of different regions and markets, and identify the customer segments and product categories that contribute most to sales. It will also examine which products are most profitable and how sales change over time.

The findings will be presented in an interactive dashboard to make the information easy to understand. Based on the results, I will also make recommendations on how the business can improve sales, increase profit and make better decisions.

Conclusion

Business Intelligence helps organisations understand their data and use it to make better decisions. Dashboards make this easier by presenting important information in a clear and simple way. Through this project, I will use Power BI to analyse the Global Superstore dataset, identify useful business insights and suggest ways the company can improve its performance.
